

Patient: **Monson, Berdia M**

Sex: Female

DOB: 05/01/1937

Exam: CT C/A/P W/ CONTRAST (66666W)  
DOS: 03/12/2026 12:30 PM

Acc# 594E7BA1CF01  
MRN# 1095086

Ref. Phys: APPALANAIDU SASAPU

PROCEDURE: CT CHEST, ABDOMEN AND PELVIS WITH CONTRAST

COMPARISON: 2/17/2026

INDICATIONS: Endometrial cancer

TECHNIQUE: Negative oral contrast was ingested prior to the procedure. 80 cc Visipaque was administered intravenously.

CHEST: Stable exam. Lungs unchanged with no acute infiltrate, indeterminate nodule, or mass. Lymph nodes are stable with no enlarging lymph node tissues. Stable appearance of heart and great vessels in this patient that has had previous CABG. Skeletal elements are stable.

ABDOMEN AND PELVIS: Rounded masslike contour abnormality of lower left pelvic sidewall along superior margin left vaginal cuff tears larger in volume. This corresponds to site of hypermetabolic activity that was seen on previous PET/CT and is suspected represent growing recurrent/implant disease. Increase in size seen in several lymph nodes of retroperitoneal space abdomen and pelvis. Stable unremarkable appearance of surgical bed in the pelvis. Liver enhances normally. Pancreas, spleen, and adrenal glands remain unremarkable. Tiny cortical cysts are again seen in both kidneys which are otherwise unremarkable. Noninflamed diverticulosis descending and sigmoid segments of the colon. Bowel segments otherwise unremarkable. Stable periumbilical hernia. Skeletal elements stable.

**IMPRESSION:**

1. There are findings concerning for evidence of recurrent/growing implant disease of lower left pelvic sidewall/vaginal cuff margin.
2. There are several enlarging lymph nodes of abdomen and pelvis level are concerning for growing metastasis.
3. No evidence metastatic disease at chest level.

**QUALITY MEASURE:** Our record at this facility shows this patient has had 1 CT and PET/CT studies and 0 cardiac nuclear medicine (myocardial perfusion) studies in the 12-months period prior to the current study. DICOM format image data are available on a secure, media free, reciprocally searchable basis with patient authorization for at least a 12-month period after the study. The following dose optimization techniques were used for the performed procedure: automated exposure control and adjustment of the mA and/or kV according to the patient size.
